

The Daily Stack

A finite daily tech news edition for practitioners — project submission

WHAT THIS IS

Tech news today is scattered across Hacker News, X, Reddit, LinkedIn, and a dozen newsletters, wrapped in hype and delivered as an infinite feed that never says "you're done." The Daily Stack is a calm, finite daily edition built specifically for people who work in tech — one dated front page, exactly ten curated stories, five sections, and a clear end-of-edition moment. No infinite scroll, no algorithmic feed, no personalization.

PROBLEM & TARGET USERS

Primary users: working software engineers and IT professionals, engineering leaders and tech PMs who need industry awareness for decisions, and CS students or career-switchers building a habit of staying informed. Deliberately not "everyone in tech" — the editorial voice and section mix are tuned for practitioners.

Core insight: a finite daily edition ("you've read today's tech news, go build something") is the differentiator against infinite feeds — the same mechanic that drove the daily habit behind the morning newspaper.

PRD SUMMARY

North-star metric	Next-day return rate — target 30%+ within 30 days of launch
Must-have scope	Daily edition, 5-section structure, article cards (headline / summary / source / link), anchor-scroll nav
Explicitly out of scope	Personalization, infinite feed, social features, real-time breaking news, games/puzzles (cut from v1)
Key open question	Shape of the automated curation pipeline (sources, summarization model, publish trigger)

Full spec: `docs/prd.md` in the project repo — includes goals, non-goals, user stories, acceptance criteria (Given/When/Then), risks & assumptions, and success metrics.

TECH STACK

Frontend

- Next.js 16 (App Router) + TypeScript
- Tailwind CSS v4
- Fonts: Source Serif 4 (headlines) + Inter (body)

Data layer

- Supabase (Postgres) — schema defined, not yet connected
- Local seed data fallback (zero-setup local dev)
- Data-access layer abstracts the source, so connecting Supabase later needs no component changes

DEPLOYMENT STATUS

NOT YET DEPLOYED

Currently runs locally (`npm run dev`) and is version-controlled on GitHub (`github.com/franipd/the-daily-stack` , private repo). The project is configured for Vercel deployment but has not been deployed to production — per project guardrails, deployment requires explicit confirmation before running.

The Daily Stack — continued

CLAUDE CODE WORKFLOW & SKILLS USED

This project was built end-to-end with Claude Code. The skills and conventions used:

`/prd-generator` `/newsletter-ideator` `/redesign-skill` `CLAUDE.md` project config `AskUserQuestion` for scope decisions

- **prd-generator** — generated the initial PRD from a feature brief, then iterated through user answers on scope (story count, curation automation, puzzle removal, publish trigger)
- **newsletter-ideator** — generated 7 editorial angles for positioning the product's story (selected "story-first" angle and outlined a launch narrative)
- **redesign-skill** — audited the initial plain-Tailwind UI and applied a targeted editorial redesign: serif/sans font pairing, warm off-white palette with one accent color, rule-line dividers, hover states — without rewriting the existing component structure

CLAUDE.MD — PROJECT CONFIGURATION

A project-level `CLAUDE.md` file in `Module1_Project/` documents:

- Product context, linking to `docs/prd.md` as the source of truth for scope
- Tech stack and repo structure
- Content/publishing model (manual-trigger publishing, finite 10-story editions)
- Visual design tokens (fonts, color variables, masthead pattern) so future changes stay consistent with the established design system
- **Guardrails:** never deploy without asking first; treat Supabase credentials as secrets

SCREENSHOTS — CURRENT BUILD

Front page — masthead and AI/ML section, redesigned editorial styling

Infrastructure/Cloud section via anchor-scroll nav — active link underlined in accent color

IMPROVEMENTS PLANNED

- **Automated curation pipeline** — RSS ingestion from real sources (Hacker News, vendor blogs, security advisories) → dedup → LLM summarization (Claude) → draft edition, with manual publish approval
- **Live Supabase connection** — swap from seed data to a real database; schema is already defined in `supabase/schema.sql`
- **Digest email sign-up** — should-have user story from the PRD, not yet built
- **Deployment to Vercel** — pending explicit go-ahead
